#### SIL-ALL HAY+

Application	1 l/T
Pack size	10Kg
Treating	40T

#### FORAGE (%MC)

Grass	15 - 25
Alfalfa	15 - 25
Bi crop	15 - 25

*Sil-All Hay is not a substitute for good baling practise or for good management / storage practise. Forage should not be baled if the moisture content is above 25% and regular assessment of moisture content during baling should be made.*

*Sil-All Hay+ is free from any strong odours, and is non corrosive to machinery*

## What is Sil-All Hay+?

Sil-All Hay+ is a high specification, broad spectrum hay additive, designed to extend the hay baling window. Containing 3 individual anti-fungal chemicals with different, individual modes of action.

## How to *apply* Sil-All Hay+?

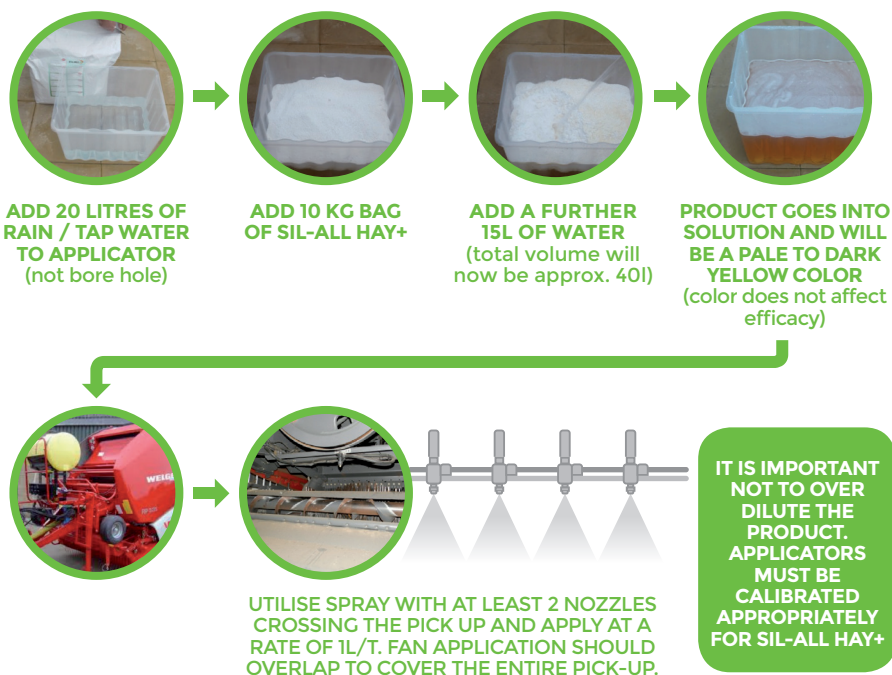

Sil-All Hay+ is a controlled combination of chemicals supplied in a 10Kg bag for 40t treatment.

Product can slightly compact through storage but quickly reverts to a free flowing powder. It will float on the top of the water but quickly hydrates with agitation.

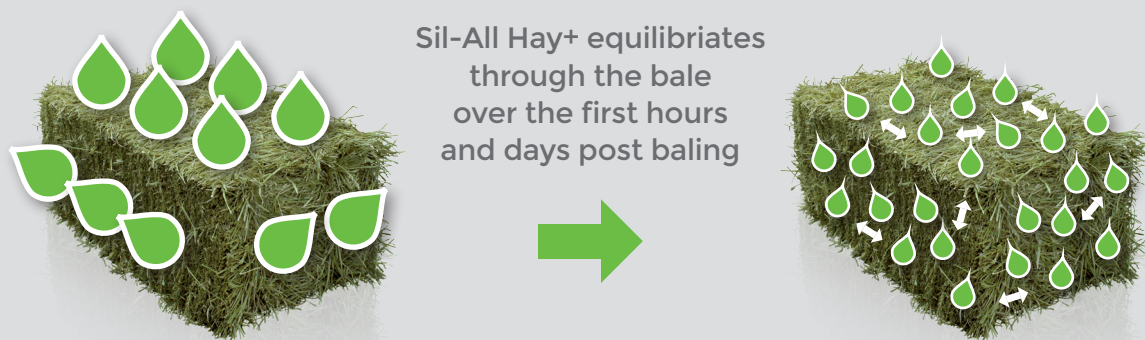

Product will remain hydrated and 'fit for use' for upto 3 months. Some crystallisation may occur depending on water quality and temperature but crystals will go back into solution with agitation.

It is recommended that product be hydrated 30 minutes before being required for use.

Sil-All Hay+ is equally effective on round and square bales, and equally effective on all hay types.

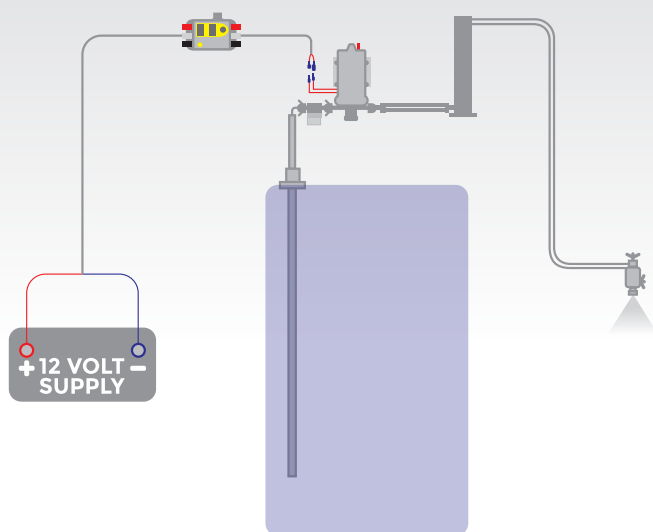

## How does it *work* in the bale?

Sil-All Hay+ is applied as a concentrated solution to the bale. In the same manner that the surface moisture in the baled hay naturally equilibrates through the bale, killing naturally occurring yeast and mould as it moves through the bale and allowing the bale to cure more safely.

## Precaution *of use* with the applicator

Basic system for applicator. Source: Selmech

It is important to ensure that the applicator, hosing and nozzles are free of any residual chemical / acid, or, if switching from using Sil-All Hay+ to using another treatment (if a customer harvester) that the tank be drained of Sil-All Hay+.

*Distributed by:*

EU approved (EC N°1831/2003) – Premixture of silage additives for use in all forages and all animal species with the potential to improve the production of silage and increase aerobic stability.

Not all products are available in all markets nor associated claims allowed in all regions.
